                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the human chorionic gonadotrophin beta subunit (beta-hCG), carboxy-terminal loop mutant Argidiu.

Argidia, Gify-Miss, Val7981s, which can be used in the preparation of a contragestative medicament. The modified beta-hCG has reduced cross-reactivity with luteinising hormone (HH), as defined by the ability of both proteins to react with the same antibody. The modified beta-hCG can be used as a contraceptive in females, in a woachie, in a hCG specific immunosasy and for applications where hCG is active, e.g. Kaposi sarcoma inhibition. The modified on contractive with other natural hormones.

N.B. Sequence not given in the specification, but constructed using the wild type beta-hCG sequence given in nature 307 958460, 37-40 (1984).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 SKEPLAPRCRPINATLAVEKEGCPVCITVNTICAGYCPTWTRVLQGVLPALPQVVCNYR 60

Liker-human CG-alpha(1-92)[NSX.N18X]) is an example of a chimaric glycopeptide hormone having an extra glycosylation site. Addition of oligosaccharides has a positive effect on stability of hormones in circulation and can be used to prevent unwanted antibody or receptor interactions. The present analogue has anti-inteninsing hormone (lutropin) activity and can be used for facilitating owulation, terminating pregnancy and reducing androgen secretion.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Single chain gonadotropin analogue 1b with extra glycosylation site.
                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is an analogue of mature hCG beta subunit having residues 40, 42, 45-48, 52, and 55 replaced by the corresponding residues in the equine LH protein. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, see AARISO43, AARISO61-RISI25 and AARISO61-RISI98.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Single chain gonadotropin; human chorionic gonadotropin; hCG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is an analogue of mature hCC beta subunit having residues 12, 75, 89, 91, 92 and 99 replaced by the corresponding residues in the human LH protein. The chimeric hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in male and fee promotion of fertility in male and female and males.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                           Glycoprotein hormone; immuno-castration;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1;
               The sequence is an analogue of mature hCG beta subunit having residues 47.30 deleted and residue 51 changed from alanine to proline. When combined with the alpha subunit this construct has been shown to bind LH receptors and stimulate hos for induced cyclic ANP accumulation at ca. 50% the efficacy of hCG. This reduces the sterologoenic potency of the analogue. It may be useful as an agonist for supression of gonadal activity during chemotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1; Indels 4; Gaps

The chimeric hormone may be useful as a TSH anasonist for the treatment of hyperthyroidism. See AMISIOG14, ARH3061-R13125 and AAR13161-R15198.

                                                                                                                                                                                                         0; Gaps
                                                                                                                                                                                                                                                                                                The sequence is an analogue of mature hCG beta subunit having residues 40, 42, 46-48, 51, 52, and 55 replaced by the corresponding residues in the bovine LH protein. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, see AAR15043, AAR15061-R15125 and AAR15161-R15198.
                           The sequence is an analogue of mature hCG beta subunit having residues 2, 9, 10, 15, 42, 47 and 51 replaced by the corresponding receiptues in the human LH protein. The chimertc hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in male and female animals.

of a contragestative medicament. The modified beta-hCC has reduced cross-reactivity with lutenhising hormone (LB), as defined by the ability of both proteins to react with the same antibody. The modified beta-hCC can be used as a contraceptive in females, in a vaccine, in a hCG specific immunosasy and for applications where hCG is active, e.g. Kaposi sarcoma inhibition. The modified beta-hCC can produce neutralising antibodies to beta-hCG, which do not cross-react with other natural hormones.

N.B. Sequence not given in the specification, but constructed using the will type beta-hCG sequence given in nature 307 959460, 37-40 (1994).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is an analogue of mature hCG beta subunit having residues 1-7 deleted. It may be useful as an agonist for supression of gonadal activity during chemotherapy. See AARIS043, AARIS061-RIS125 and AARIS161-RIS198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Glycoprotein hormone; immuno-castration; immuno-contragestive; vaccine; human chorionic gonadotropin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAR15165 standard; Protein; 137 AA.

It was prepd. using PCR mutagenesis to lineart a stop codon into the gene. It may be useful as an agouist for superasion of gondall activity during remembeherapy. See AARI3043, AARI3061-R15125 and AARI5161-R15199.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a human chorionic ganadotrophin (hCG) beta subunit mattern. The invention relates to a method of forming a cysteine subunita mattern. The invention relates to a method of forming a cysteine CK knot protein (1) having alpha and beta-subunits comprising attaching a dimerisation domain (DD) to either the N-termin of both subunits or the dimerising the products to form a heterodiaeric protein analog (II). The method is used to produce analogues (agonists or antagonists) of ceglycosylated giveorotein hormongs, potentially useful, e.g. for treating infertility where caused by polycystic ovarian disease. Cassociated with excessive levels of inteinising hormone). Products that retain DD's are also useful as immunogens or artigens (since a DD may containing highly antigonic amino acid sequences). Attachment of a DD may containing highly antigonic amino acid sequences). Attachment of a DD may containing highly antigonic amino acid sequences). Attachment of a DD may containing night as immunogens or artigens (since a DD may containing highly antigonic amino acid sequences). Attachment of a DD may containing night of activities, and allows the combination of subunits that the subunitary propretein hormone may be modified without loss of activity, and of a tatchment of the DD reduces formation of homodimers. Heterodimers have longer circulation times in vivo than individual subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; mutein; Beta subunit; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins

```
The sequence is an analogue of mature hCG beta subunit having residues 39, 41-43, 55, 56, and 88 replaced by the corresponding residues in the hFSH protein. It was prepd. by site directed mutagenesis of a cDNA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in man and women and the promotion of fertility in male and female animals. (See AAR1S04). AAR15061-R15135 and

The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, see AAR15043, AAR15061-R15125 and AAR15161-R15198.

                                                                                                                                                                                                                                                                                        The sequence is an analogue of mature hCG beta subunit having residues 42, 47, 51, 77, 87, 89, 91, 92, and 99 replaced by the corresponding residues in the human LH protein. The chimmeric hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in male and female animals. See AAR1904, AAR15061-RISI25 and AAR15161-RISI98.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New glyco-protein hormone analogues for inducing fertility as
immuno-castration agents, for suppressing reproductive system
development and as immuno-contragestive vaccines.
                                                                                                  New glyco-protein hormone analogues - for inducing fertility a 
immuno-castration agents, for suppressing reproductive system

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is an analogue of mature hCG beta subunit having residues in the hF8H procedor. We are success in the hF8H proceding the was prepal by site directed mutagenesis of a cDNA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the proceding of fertility in male and female animals. residues in the hESH protein. It was prepd by site directed mutagenesis of a cobh sequence encoding the hCG bets subnit.

The Chimaric bramen is capable of directing hormone binding to both us and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AAR15043, AAR15061-R15125 and

This sequence is a fusion protein of Hill/HCC and Jun. The invention relates to a method of forming a cysteline knot protein (1) having alpha and beta-subunits comprising a traching a dimerisation domain (DD) to ceither the N-termin of both subunits of the both subunits of the products to form a heterodimeric protein analog (II). The method is about to do form a heterodimeric protein analog (II). The method is used to produce analogues (aspoils to or integonits) of deglycosylated cyproprotein normones, proteinially useful, e.g. for treating infartility (where caused by polycystic ovariand disease (associated with excessive contents of intennising hormone). Products that retain DD's are also useful as immnogens or antigens (almee a DD may contenting) highly antigent earlino acid sequences). Attachment of a DD (Which may be removed later) and thus receptor-binding and immunogenic properties) to native dimers, and allows the combination of subunits that would otherstee combination of subunits that would otherstee combination of subunits that would otherstee complication times in complete the completed in the produces of committed the subunitation of homodimers. Heterodimers have laid the produces of committed and the subunities.

                                                                                                                                                                                                                                                                                                                                                                                    The sequence is an analogue of mature hCC beta subunit having residues 102-110 replaced by the corresponding residues in the hTSH procedur. The chimeric hormone may be useful as a TSH antagonist for the treatment of hyperthyroidism.
                                                                                                                                                                                                                                                                                               New glyco-protein hormone analogues . for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
 Glycoprotein hormone; fertility; immuno-castration;
immuno-contragestive; vaccine; human chorlonic gonadotropin;
thyroid stimulating hormone; TSH: GG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is an analogue comprising amino acids 7-145 of mature hGG beta subunit having residues 7, 8, 10, 11, 12, 14, 16, and 18 replaced by the corresponding residues in the hFSH proceso. It was prepd by site directed mutagenesis of a cDNA sequence encoding the hGG beta subunit. The chimerit horamone is capable of directing horamone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AAR15043, AAR15062-R15125 and AAR15161-R15198).

The sequence is an analogue of mature hCG beta subunit having residues yes. 19.41.43, and 45-53 replaced by the corresponding residues in the hESH protein. The chimeric hormone is capable of directing hormone blading to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animais. (See AAR15043, AAR15061-RIS125 and AAR15061-RIS125 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                             The sequence is an analogue of mature hCC beta subunit having residues 94-96, 103-105, 107, 110 and 112-115 replaced by the corresponding residues in the equine LH protein. The chimaric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, agoints and/or andson/18t.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New glyco-protein hormone analogues - for inducing fertility a 
limmuno-castration agents, for suppressing reproductive system 
development and as immuno-contragestive vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is an analogue of mature hCG beta subunit having residues 39, 41-50, 53, 55 and 88 replaced by the corresponding residues in the hTSH protein and the sequence LFL from hTSH inserticed in place of residue 47. The chimeric hormone may be useful as a TSH antagonist for the treatment of hyperthyroidism. See AARISO61-R15125 and AARIS161-R15196.

The antigenic peptides of the invention are synthetic analogues of regions of this sequence. The peptides are preferably analogues of HCG beta residues 38-57. The invention provides a method for the antigenic modification of peptides. The peptides can then be coupled to carrier elicit anti-HCG antibodies (but at a lower level than the native peptide) and do not elicit antibodies (but at a lower level than the native peptide) and do not elicit antibodies to human luterinising hormone. The conjugates that a method for vaccine development or to produce polyclonal antisera for danostic assays. Depending on the peptides used, the vaccines can be used to treat hormone and endocrine related tumours, cancers, and characterising (especially using anglotensin related peptides), and diabetes and associated vascular diseases, or as anti-pregnancy vaccines

the invention relates to the production of analogues of a heterodimeric subunit glycoporotein hormone (GPR) e.g. human chorionic gonadotropin of (hCG), human lutenising hormone (HFSH), human flytoid stimulating hormone (hFSH), and functional muterins, which are modified to contrain an intersubunit distipline boad, between an alpha-subunit cystelia and iterasubunit cysteliae, for improved stability, the analogue retaining at least a portion of the injocativity for the corresponding native GPH receptor. This sequence to represents a chimaric horgyles are designed specifically to reduce perturbation of the Jupoved analogues are designed specifically to reduce perturbation of the Jupoved analogue stabilise for the hormone, thereby creating greater likelihood that the dimer vill be formed in vivo and the formed dimer will have affinity for the native receptors and have gastistic activity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses
                                                                                                                                                          Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human tocrionic gonadotropin; human lutelnising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

hCG/hFSH chimeric beta subunit CFC101-114-beta'099C.

```
The invention relates to the production of analogues of a heterodimeric subunit giycoportein hormone (GPH) a.9. human chorionic goadedcropin (CC (hCG), human interialising hormone (HCH), human interialising hormone (HCH), human interialising hormone (HCH), human interialising hormone (HCH), human follicle stimulating contents, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for improved stability, the analogue retaining at least a portion of the blacktivity for the corresponding native GPH receptor. This sequence cepresents a mutant chimeric hGCAPEH's beta subunit used for generating the modified GPHs. The improved analogues are designed specifically correcting greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have sequence catevity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               5;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is an analogue of mature hCG beta subunit having residues 39, 41-43, 45-55, 55, 56, and 58 replaced by the corresponding residues in the hESI protein. It was prepd. by site directed mutagenesis of a cDNA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone bluding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and feale animals. the invention relates to the production of analogues of a heterodimeric subunit giycoprotein hormone (GPH) a.9. Awam ofboiloic gondoficiopin (bCG), human luteinising hormone (HeH), human follicle stimulating hormone (HeH), human follicle stimulating hormone (HeH), human follicle stimulating connece (HeH), human follicle stimulating more decided to contain an intersubunit disuphide bond, between an alpha-subunit cysteine and a beta-subunit disuphide bond, controved stability, the analogue retaining at least a portion of the improved stability, the analogue retaining at least a portion of the colorabonding native GPH receptor. This sequence crepresents a mutant chimaric hock/heH; beta subunit used for generating to reduce perturbation of the 3-dimensional structure of the hormone, to reduce perturbation of the 3-dimensional structure of the hormone, condition of the 3-dimensional structure of the hormone, the bloogical activity on them. The changes stabilise the GPHs and prolong as for the native GPHs and prolong as for the native GPHs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence is an analogue of mature hCG beta subunit having residues 39-55 deleted. It was preped using PCR mutagenessis to Insert a stop codon into the gene. It may be useful as an agonist it is supression of gonadal activity during themotherapy. The invention relates to the production of analogues of a heterodimeric subunit giycoporotein hormone (GFB) a.9. Imman chorionic gonadotropin (bCG), human intensials promone (HBB), human follicle stimulating hormone (HBB), human follicle stimulating hormone (HBB), human follicle stimulating contense (HBB), human follicle stimulating matterials, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine, for the cortesponding article GBH septimulating, the nanlogue retaining at least a portion of the bioactivity for the corresponding native GBH seeptor. This sequence cortexpresents a material Angelia and for the general and perfect of the formone, the major of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have against a cativity on them. The changes stabilise the GPHs and prolong as for the native GPHs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     81 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 140

The sequence represents the amino acid sequence of single chain good of the sequence represents the amino acid sequence of single chain goodsdroptin analogue 12. The givocoprotein homomon analogue 13. The givocoprotein homomon and out of the conditions of the homomon caseful for generating antibodies specifically immunoraactive with new compounds, as a substitute for the heterodinarie of the homomon of the treatment of infertility, as an aid for in vivo fertilisation techniques, and in other therapeute methods associated with the native confiners similar to the heterodinary as a disponsatic tool to detect the confiners and in other therapeuter to the native protein in the presence of antibodies with respect to the native protein in the longical samples, as a control reagent in assay kits for assessing the presence of antibodies with respect to the native proteins in the puritying receptors to which the native homomons bind: The single chain forms of the heterodimers or homodamers have the following advantages over their dimeric forms: they are more stable, problems of recombinant protein are reduced since only a single chain forms cuning of activity levels and of in vivo half lives. Single chain forms care unique starting materials for identifying truncated forms with the activity of the dimer. The linkage between the subunits permits the cattvity of the dimer. The linkage between the subunits permits the protein to be engineered without disturbing the overall folding of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; single chain gonadotropin analog no:2; anti-infertility; drug; peptude therapy; luterinsiang hormone, H; folilcle stimulating hormone; FSH; thyroid stimulating hormone; TSH; chorionic gonadotropin; CG; glycoprotein; infertility; fusion protein.
                                                                                                                     New single chain forms of the glycoprotein hormone quartet useful for generating antihooles specifically immunoreactive with the new compounds in treating infertility, or as aids for in vivo fertilization techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    5
                                                                                                                                                                                                                                                                                                                                           The sequence is an analogue of mature hCG beta subunit having residues 39, 41-43, 45-55, 55, 56, 58, and 44-97 replaced by the corresponding residues in the hESH protein. It was pread, by site directed mutagenesis of a cOMA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone binding to both LH and RSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AARISO43, AARISO61-R15125 and AARIS161-R15199).

It was prepd. using PCR mutagenesis to Innert a stop codon into the gene. It may be useful as an agonist for supression of gondal activity during themotherapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human single chain forms of the glycoprotein character of common quarter which is an agonist or antagonist of lucial sing hormone consomment of common quarter which is an agonist or antagonist of lucial single hormone (Lis), follicle stimulating hormone (C. 19.), follicle stimulating hormone see the stimulating hormone see the consomment of single chain hormones are used in treating infertility, as adds forms of single chain hormones are used in treating infertility, as adds in vitro fertilization techniques, and other therapeutic methods associated with the native hormones. The single chain hormones are useful as reagents in a manner similar to heterodimers, as diagnostic tools to detect the presence of antibodies with respect to the native proteins in bloogical samples, as control reagents in assay ties for assessing the levels of these hormones in various samples, in detecting and puritying receptors to which the native hormones bind; the single chain hormones are also used in affairly chromatographic preparation of receptors or continuous and into the native preparations of these materials and to monitor subsequent bergans as puritication tools for solution of subsequent preparations of these materials and to monitor isolation of subsequent preparations of these materials and to monitor of the preparation of subsequent preparations of these materials and to monitor of subsequent beginner of supplement of single chain hormones administered as dugs. The single chain of subsequent expense the present sequence is highman single chain quage to the networdiment forms of hormone are also an original constant of the invention. Analog no: 2 is a fusion protein constant of the invention of subsequent of hormone expective this smallog serves as a useful starting compound for template directed vaccine design and for the development of hormone-specific vaccine design and for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

```
This sequence is a fusion protein of hcc/HESH and Jun. The invention relates to a method of forming a cysteine knot protein (1) having alpha can beta-subunits comprising a tysteine knot brotein (1) having alpha can beta-subunits comprising attaching a dimerisation domain (DD) to either the N'terminio for both subunits or the N-terminios of the cathorian of the C-terminios of the cathorian and timerising to the products to form a heterodimeric protein analog (II). The method is the products to form a heterodimeric protein analog (II). The method is used to produce analogues (agoingts or antagonists) of deglycosylated glycoprotein hormones, potentially useful, e.g. for treating infattility where caused by polycystic ovarian disease (associated with excessive lavels of luteinising hormone). Products that retain DD is are also useful as immunogene or antigens (since a DD may contraining highly antigenic cannon acid sequences). Attachment of a DD (Which may be removed later) facilitates the formation of heterodimers; that have similar structures and allows the combination of subunits that vould other-view companies. On out at all The N'terminal part of a glycoprotein hormone may be modified without loss of activity, and attachment of the DD reduces (formation of humits.
                                                                                  Cysteine knot protein; protein formation; heterodimeric protein analog; deglycostated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hGG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2 SKEPLAPRCRPINATLAVEKECCPVCITYNTTICAGYCPTHFWLGOVLPALGOVVCHTR 61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence is a fusion protein of hGC/HESH and Jun. The Invention relates to a method of forming a cysteine knot protein (i) having a lipha and relates to a method of forming a cysteine knot protein (ii) having a lipha and beta-subunits compension of the ethics of the white the N-termino of both subunits or the N-terminos of the object of the C-terminus of the beta-subunit and to the C-terminus of the beta-subunit and inmerising the products to form a heterodimeric protein and and [1]. The method is the products to form a heterodimeric protein and and [1]. The method is given by products of the C-terminus of the confidence in the constant of the confidence in the combination of all menuogens or antigens (since a but may be removed later) and the subunity of the formation of heterodimers, that have similar structures and allows the formation of subunits that would otherwise combine of subunits that would otherwise combines and allows the combination of subunits that would otherwise combine to be only or and at all or the subunities. Heterodiment of the Do reduces to formation of homodimers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
               Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

```
Analogue 2 (human CG-beta(1-114)-linker-human CG-alpha(1-92)) is especific example of a stople chain goadoctropin having a chorioni gonadoctropin (CG) beta-subunit at the N-terminus and a CG alpha subunit at the C-terminus, joined by a linker of 1-16 anion acida. The analogue has luteinising hormone (lutropin) activity and is useful for inducing ovulation and increasing male fertility.
                                                                                                                                                                                                                      Single chain gonadotropin; human chorionic gonadotropin; hCG; highs; beta; subunit; analogue; glycoprotein hormone; fertility; inhibit; stimulate; increase; lutropin; luteinising hormone; LH; folilicle stimulating hormone; FSH; vaccine; contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Methods for altering fortility in mammals, esp. humans - e.g. stimulating fertility by reducing the activity and/or levels of circulating slycoprotein hormones having lutropin activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            82.2%; Score 639; DB 16; Length 234; 94.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is a fusion protein of HCC/HTSH and Jun. The invention claims to a method of forming a cystelne knot protein (i) having alpha and beta-subunits comprising a ttaching a dimerisation domain (DD) to either the N-terminio of both subunits or the N-terminio of the comprision of the paper of the products to form a heterofularic protein analog (II). The method is alpha-subunit and to the C-terminus of the beta-subunit and dimerising the products to form a heterofularic protein analog (II). The method is used to produce analogues (agonists or antagonists) of degly/cosylated disproportein hormones, potentially useful, e.g. for treating infertility where caused by polycytic ovarian disease (associated with accessive values of lutenising hormone). Products that retain DD's are also useful as immunogens or antigons since a DD may containing Highly antigonic anino acid sequences). Attachment of a DD (which may be removed later) facilitates the formation of a DD (which may be removed later) and latus the compliants that would other-ties combine poorly, or not at all. The N-terminal part of a glycoprotein hormone may be mentioned individual subunits.
                                                                                                                                                    Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              62 DVRFESIRLPGCPROWPVVSTAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

The invention relates to human single chain forms of the glycoprotein chromone quarter. Which is an agonist or antagonist of lutefablishing hormone (LH), follicle stimulating hormone (FSH), thyroid stimulating hormone (FSH), thyroid stimulating hormone (FSH) or chorionic gonedorropin (CG). All these hormones are heterodimers having identical alpha subunits and differing bets subunits. The agonist forms of single chain hormones are used in treating infertility, as aids in vitro fertilisation techniques, and other therapeutic methods as sociated with the native hormones. The single chain hormones are used in associated with the native hormones. The single chain hormones are used in detect the presence of antibodies with respect to the native proteins in biological samples, as control respect to the native proteins in biological samples, as control respect to the native proteins in biological samples, as control respect to the native proteins in levels of these hormones in various samples, in detecting and purifying
                                                                                                                                                                                                                                                                                                                                                              Region Those "Wild type Asn substituted with Xaa, Where Xaa refers to Gln or other amino acid"
135.142 Those peptide "Linker peptide"
Region 143.234 Corresponds to 1-92 amino acids of human single Misc-difference 194

It was prepd by the state directed mutagenesis of a DNA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone binding to both id and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AAR15043, AAR15061-R15125 and AAR15161-R15198).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTHTRVLGGVLPALPQVVCNYR 61

The sequence represents the amino acid sequence of human chorionic conaddructopin (160) beta, amino acids 111. The protein is an important glycoprotein hormone heterodimer, along with luteinising hormone (EM), follicle stimulating barmone (FSM), thyroid stimulating bromene (EM), follicle stimulating barmone (FSM), thyroid stimulating broteins are useful for generating antibodies specifically hormone (TM), which all have identical alpha subunits but differing beta subunits. The proteins are useful for generating antibodies specifically forms of the hormones, in the treatment of infertility, as identified forms of the hormones. The single chain proteins a lid for in vivo fertilisation techniques, and no other therapeutic methods associated with the native hormones. The single chain proteins are further useful as reagents in amenner similar to the heterodimers, as diagnostic tools to detect the presence of antibodies with respect to the native proteins in the bloigical samples, as control reagents in assay kits for assessing the levels of these hormones in various samples, and in detecting and purifying receptors to which the native hormones bid. The single chain forms of the heterodimers are more stable, confolution are reduced since only a single gene to probleme the semiting fine tuning of activity levels and of incente form the single chain forms are unique starting materials for identifying the cumunity permits the protein. One engineered without disturbing the coverall folding of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; single chain gonadotropin analog; anti-infertility; drug; peptide therapy; lutenfainsing hormone; IH; follicle stimulating hormone; FSH; thyroid stimulating hormone; TSH; chorionic gonadotropin; CG; glycoproten; infertility; fusion protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                QQ
creeptors to which the native hormones bind. The single chain hormones are also used in affinity chromatographic preparations of receptors or authormone antibodies. They are used as purification tools for stations of absequent preparations of these materials and to monitor to slading of single chain hormones administered as drugs. The single chain of stropcretains are used to generate antibodies specifically immunoreactive cyclevels of single chain hormones administered as gredifically immunoreactive three new compounds, as substitutes for the heterodimeric forms of hormones. The present sequence is human single chain gonadotroph apprecian consisting of human corions (small provided consisting of human single chain gonadotroph alpha subunit (1-114 anino acids) fused to human single chain gonadotroph alpha subunit (1-32 anino acids) by a linker sequence. This analog serves as a useful stating compound for template directed vaccine design and for the development of hormone-specific vaccines for use in humans.

C Note: The present sequence is not shown in the specification, but is delivered from the human single chain gonadotropin analog not; shown
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; chorionic gonadotropin; hCG; glycoprotein hormone; infertility; lucenising hormone; HH; follicle stimulating hormone; FSH; thyrold stimulating hormone; TH.

This sequence is a fusion protein of hcG/HTSH and Jun. The invention cleicas to a method of forming a cystelie knote protein (1) having alpha cleicas to a method of forming a cystelie knote protein (1) having alpha cleicates to a method of forming a cystelie knote protein (1) having alpha cather the N'terminio of both subunits or the N'terminio of the catherine of the beta-subunit and to the C-terminus of the beta-subunit and dimerialing the products to form a heterodimeric protein analog (11). The method is the products to form a heterodimeric protein analog (11). The method is considered to produce analogicase (asociated with excessive where caused by polycystic ovarian disease (asociated with excessive where caused by polycystic ovarian disease (asociated with excessive lawingements of luteliating hormone). Products that retain DD's are also useful as immunogens or antigens (since a DD may concarning highly antigenic cannon acid asequences). Attachment of a DD (Which may be removed later) facilitates the formation of heterodimers; that have similar structures can allow the formation of subunities that would otherwise combines.

Cand allows the combination of subunities that would otherwise combine condition without loss of activity, and attachment of the DD reduces formation of homodimers. Heterodimers have longer circulation times in vivo than individual subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cysteine knot protein; protein formation; heterodimeric protein analog;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         81.2%; Score 631; DB 20; Length 212;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human single chain forms of the glycoprotein charmone quartet which is an agonist or antagonist of intelainising hormone conformed quartet which is an agonist or antagonist of intelainising hormone (TH), follicle stimulating hormone (FSH), thyroid stimulating hormone (TSH), thyroid stimulating hormone (TSH) and the standard hormones are exectedimens having identical alpha subunits and differing beta subunits are hearted infertulity, as olds the form of single chain hormones are used in trenties infertulity, as olds in vitro fertulisation techniques, and other therapeutic methods associated with the native hormones are useful as reagents in a manner similar to heterodimers, as diagnostic tools to confected with the native hormones. The single chain hormones control reagents in assay kits for assessing the lovels of these hormones in various samples, in detecting and puritying coepisors to which the native hormones blud; the single chain hormones are also used in affiliarly chromatographic preparation of receptors or isolation of subsequent preparations of these materials and committee containing and subsequent preparations of these materials and common or isolation of subsequent preparations of these materials and common or subsequence administered as attugs. The single chain of subsequence is human chorionic gonadotropin beta with the present sequence is human chorionic gonadotropin beta combounds. The present sequence is human chorionic gonadotropin beta substitutes for the heterodimeric forms of hormones. The present sequence is human chorionic gonadotropin beta substitute and proteins are used to generate antibodies specifically immunoractive constructing single chain gonadotropin manalogs related to the invention. Analog single chain gonadotropin manalogs related to the invention. Analog custom of subsumment of hormone-specific vaccines for the development of hormone-specific vaccines for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cysteine knot protein; protein formation; heterodimeric protein analog; deglycostylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTMTRVLQGVLPALPQVVCNYR 61

This sequence is a fusion protein of ECC/FTSH and Jun. The invention relates to a method of forming a cystein knot protein (i) having a alpha can beta subunits comprising attaching a dimerisation domain (DD) to ceither the N-terminol of both subunits or the N-terminol of the comprision at the case of the 
                                       Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic overlan disease; hCG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ouery Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence is a fusion protein of hcC/HTSH and Jun. The Invention relates to a method of forming a cysteine knot protein (1) having alpha and beta-subunits comprising attaching a dimerisation domain (Db) to either the N-termin of both subunits or the N-terminus of the citizenth of both subunits or the N-terminus of the both subunits or the N-terminus of the claim of the C-terminus of the beta-subunit and dimerising the products to form a herecodimeric protein andlog (II). The method is used to produce analogues (sqonists or antagonists) of deglicosylated glycoprotein hormones, potentially useful. e.g. for treating infertility where caused by polycystic ovarian disease (associated with excessive twents of interhising hormone). Products that retain Db's are also useful as ammongened or antigens (since a Db may containing highly antigenic anino acid sequences). Attachment of a Db (Which may be removed later) and allows the combination of subunities that would otherwise combines and allows the combination of subunities that would otherwise combines. Deportly, or not at all The N-terminal part of a dycoprotein hormone may be conditted without loss of activity, and attachment of the Db reduces by Cormation of homodimers. Heterodimers have longer circulation times in vivo than individual subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  189 DVRFESIRLPGCPRGVPPVVSYAVALSCQCALCHTDYSDCIHEAIKTNYCTKPQKSYSSS 248

The partially deglycosylated analogue has anti-lutedinising hormone (lutropin) activity and can be used for facilitating ownimition, terminating pregnancy and reducing androgen secretion. The effects of analogue 2a depend upon the time it is administered; will minibit fertility when given marry in the menstrual cycle but will inhibit fertility when given later.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2 SKEPLRPRCRPINATLAVEREGCPVCITVNTTICAGYCPTMTRVLQGVLPALPQVVCNYR 61

                                                                                                            οž
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the production of analogues of a heterodimeric subunit gycoportein hormone (DPH) e.g. human chorionic gondouropin conduct gycoportein hormone (DPH) e.g. human chorionic gondouropin conducting the conduction of the conductivity for the corresponding native GPH receptor. This sequence represents a chimaric hosfyfs: beta subunit in which amino acid residues of the modified GPHs. The inspected analogues extending a testa position of the conductivity for the corresponding native GPH receptor. This sequence represents a chimaric hosfyfs: beta subunit in which amino acid residues of the modified GPHs. The inspected analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, the modified GPHs. The inspected analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have assign static activity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

```
The sequence is an analogue of mature has beta subunit having residues 99, 113 and 115-712 replaced by the corresponding residues in the human if protein and residues 123-45 deleted. The chimeric hormone may be useful in the treadment of infertility fine chimeric owners and the promotion of fertility in male and female
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPR 115

                                                                                                                                                                                                                                                                                                    The sequence is an analogue of mature hCG beta subunit having residues 112-145 deleted. It was prepd. using PCR mutagenesis to linear a stop codon into the gene. It may be useful as an agonist for supression of gonadal activity during chemotherapy.

See AARISOGI-RIS125 and AARISIGS-RIS198
                                                                                The sequence is an analogue of mature hCG beta subunit having residues 112, 113, and 115-114 replaced by the corresponding residues in the hTSH protein and residues 125-145 deleted. The chimeric hormone may be useful as a TSH antagonist for the treatment of hyperthyroidism. See ANRISO43, ARRISO61-RISI2S and AARISI61-RIS198.

The sequence is an analogue of mature hFSH beta subunit having several residues replaced by the corresponding residues in the hCG protein. The chimert hormone is capable of directing hormone blinding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AAR15041, AAR15061-R13193 and AAR15161-R13193)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence is an analogue of mature hCG beta subunit having residues 105-107, 100, 113, 115-117, and 119-122 replaced by the residues 105-107, 100, 113, 115-117, and 119-122 replaced by the responding residues in the bowine LH protein and residues 123-145 deleted. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunosen, agoinst and/or antagonist. See AARISO41, ARKISO61-R15128 and AARIS561-R15189.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
  New glyco-protein hormone analogues - for inducing fertility a immuno-castration agants, for suppressing reproductive system development and as immuno-contragestive waccines.

                                                                                                                                                                                                                                                                                                       The single-chain gonadotropin analogue 2b (human CG-beta(1-114) (N13X,N30X,P3X,N78Y) Linker-human CG-alpha(1-92)[N3X,N8X)] is an example of a chimeric glycopeptide hormone having an extra glycosylation site. Addition of oligosaccharides has a positive effect on stability of hormones in circulation and can be used to pervent unvanted antibody or receptor interactions. The present analogue has anti-intelnishing hormone (lutropin) activity and can be used for facilitating ovulation, terminating pregnancy and reducing androgen secretion.

The sequence is an analogue of mature hCG beta subunit comprising residues 1:115 of hCG beta having residues 102-104, and 112-115 replaced by the corresponding residues in the hESH protein. The changer is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AAR15041, AAR15061-R15125 and AAR15161-R15198).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match 75.4%; Score 586; DB 12; Length 115; Best Local SImilarity 96.4%; Pred. Single chain gonadotropin analogue #8.

```
The invention relates to human single chain forms of the glycoprotein moreone quarter which is an agonist or antagonist of lutenhising hormone (LB), folicle stimulating hormone (FSH), thyroid stimulating hormone (TSH) or chorionic gonadotropin (CG). All these hormones are heterodimers having identical alpha subunits and differing beta subunits: The agonist forms of single chain hormones are used in treating infertility, as aids in vitro fertilisation techniques, and other therapeutic methods associated with the native hormones. The single chain hormones are useful as reagents in a manner similar to heterodimers, as diagnostic tools to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence represents the amino acid sequence of single chain gondeductorpin manalogue 16. The givectorete hormone analogue 18. The givectorete hormone according antibodies specifically immunoractive with new compounds, as a substitute for the heterodimeric forms of the hormones, in the treatment of infertility, as an aid for in vivo fertilisation techniques, and in other therapeutic methods associated with the native hormone. The single chain protein is further useful as a reagent in a monner similar to the heterodimer, as a disquostic tool to detect the componer similar to the heterodimer, as a disquostic tool to detect the hormone and the presence of antibodies with respect to the native proteins in the lowel of another so of the samples, as a control reagent in assay futs for assessing the preligious of the heterodimers of homodimers have the following advantages over their dimeric forms: they are more stable, problems of recombinant production are reduced since only a single end is needed to transcribe, translate and process, provide an alternate form thus permitting fine tuning of activity levels and of in vivo half lives. Single chain forms care unique starting materials for identifying truncated forms with the care unique starting materials for identifying truncated forms with the cutivity of the dimer. The linkagh between the subunits permits the protein to be engineered without disturbing the overall folding of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New single chain forms of the glycoprotein hormone quartet useful for generating antibodies specifically immunoreactive with the new compounds, in treating infertility, or as aids for in vivo fertilization techniques

The sequence is an analogue of mature hCG beta subunit comprising residues 11:15 of hCG beta having residues 105-107, 109, 110 and 17-115 replaced by the corresponding residues in the hFSH protein. The chimeric hormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (see AARISO41, AARISO61-RIS125 and AARIS161-RIS198).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cc detect the presence of antibodies with respect to the native proteins in biological samples, as control resquest in assay kits for assessing the certal of these hormones in various samples, in detecting and purifying receptors to which the native hormones bind. The single chain hormones cc antibormone antibodies. They are used as purification tools for single-chain hormones antibodies. They are used os preparation of subsequent preparations of these materials and to monitor contains of single chain hormones administered as drugs. The single chain of yupoproteins are used to generate antibodies specifically immunorsactive dith these new compounds, as substitutes for the heterodiancic forms of consisting ones. They are used to generate antibodies specifically immunorsactive druch man of properties are used to generate antibodies specifically immunorsactive druch and properties of the invention. Analog no.8 is a fission protein consisting one related to the invention, hadlog no.8 is a fission protein cataly follow the consisting or cataly bromone (FSB) becare subunit (1-100 amino acids) by a linker sequence. This analog serves as a cuttal tarting compound for template directed vaccine design and for the development of hormone-specific vaccines for use in humans.

The sequence is that of a modified form of human chorionic gonadotrophin (MCG), amalogue "O', in which amino acids in the "D' and/or "G' regions have been subtituted resulting in changes in the binding specificity and avidity of luteinising hormone (HA) and follicle stimulating hormone (HA) and follicle stimulating beta-heterodiameric polypeptide having an affinity to vertebrate LH and FSH receptors. Such an analogue can be prepared having a desired ratio of FSH:LH activity. The polypeptide may be used for treating human infertility or polycystic ovarian disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                              Analogue 8 (hCG-beta(1-100)-hFSH-beta(95-103)-DDBR-linker-human alpha(1-29) is a specific example of a single chain gonadortropin having a chorionic gonadortropin (CG) beta-subunit at the N-terminus and a CG alpha-subunit at the C-terminus, joined by a linker of 1-16 amino acids. The analogue has follicle stimulating hormone (follitropin) and luteinising hormone (lutropin) and luteinising hormone (lutropin) acidity but is structurally mare similar to hoc then to hFSH. The analogue is useful for inducing follicle development and increasing male fertility.

The invention relates to human single chain forms of the glycoprotein channed quarter which is an agonist or antagonist of lutefinising hormone (CHJ), follicle stimulating hormone (FSH), thyroid stimulating hormone (CHJ), follicle stimulating hormone (FSH), thyroid stimulating hormone (CHJ), follicle stimulating hormones are became to the control of the control of subsets hormones are bettercodimers. CC having identical alpha subunits and differing beta subunits. The agonist formones are used in treating infertility, as alds to associated with the native hormones. The single chain hormones are useful case as reagents in a manner similar to heteroidmers, as diagnostic methods as reagents in a manner similar to heteroidmers, as diagnostic tools to detect the pressure of antibodies with respect to the native process in bodicial samples, as control reagents in assay kits for assessing the levels of these hormones in various samples, in detecting and purifying receptors to which the native hormones bind the single chain normones. The single chain normones are also used in affinity chromatographic preparation of receptors or antibodies. They are used as purification tools for antibodies are used to generate antibodies specifically immunoreactive (consisting of human chorionic gnadeforcoin (GC) beca subunit (1907 and and analog no Barelated to the Invention. Analog no: Baris a fusion protein consisting of human chorionic gnadeforcoin (GC) beca subunit (1912 amino acids) by a linker sequence. This analog serves as a useful starting compound for template directed reach paraner specific vaccines for use in humans.

C development of hormone specific vaccines for use in humans.

C development of hormone specific vaccines for use in humans.

C development of hormone specific vaccines for use as pecification, but is development with the precipilation and the human single to the propertion of the precipilation of the preci

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence is an example of a glycoprotein hormone beta-chain

that analogue used to construct an alpha, beta wheterodimer polypeptide

with altered binding affinity to LH receptor and FSH receptor. The

theterodimer preferably contains an HGC alpha-submult and a chimaeric

beta-subunit containing HGC, LH, FSH and/or thyrotropin residues.

Eliding activity and specificity may be altered without disrupting

therecodimer formation or reaction with antibodies. The Dresgion of

HGC is most important for FSH subunit and the Gregion of

EGC is most important for FSH binding, and the Gregion of

and G oritical residues of the Gregion, binds to both FSH receptor

c and LH receptor. A cDM for analogue-Q may be expressed in a

C COS-7 cell culture. This type of hormone analogue may be useful

C clinically for induction of ovulation in women with polycystic ovary

some circulating allowed.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is an example of a glycoprotein hormone beta-chain analpha, peta heta-chain analpha, peta-hetaconier polypeptide with altered binding affinity to LH receptor and FSH receptor. The heterodimer preferably contains an RG alpha subunit and a chimmeric beta-subunit containing HG, HH, FSH and/Or thyrotropin residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New alpha, beta-hetero:dimeric glyco:protein hormone polypeptide(s)

It is was used in the prepor of an alpha, beta-heterodimetric polypeptide having an affinity to vertebrate LH and FSH:LH acceptors. Such an analogue can be prepared having a desired ratio of FSH:LH activity. The polypeptide may be used for treating human infertility or polycystic ovarian disease.
                                                                                                                                                                                                                                                       0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hGG; glycoprotein hormone analogue; human infertility; LH; FSH;
luteinising hormone receptor; follicle stimulating hormone receptor;
vertebrate; polycystic ovarian disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New alpha, beta-hetero-dimeric polypeptide derivs. - which bind to tribefulsing and follicle stamitating hormone receptors, useful for controlling the ratio of FSH to LH activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Location/Qualifiers

The single-chain gonadotropin analogue [8a (hCC-beta(1-100)[NI3X,N30X]-hFSH-beta(55-103)-DDPR-linker-chaman CC-alpha(1-2)N(NSX,NSX)] can be derived from analogue 8 by removing at least one of the glycosylation sites. The partially deglycosylated analogue has antifolicle stimulating hormone (follicle and and and an analogue has not hormone (altrophin) activity and is useful for treating ovarian hyperstimulation and reducing spermatogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               οχ
                                                                                                                                                                                                                                                                                                                                                                                                ö
Binding activity and specificity may be altered without disrupting heterodian formation or reaction with antibodies. The D-region of fact is most important for th receptor binding, and the G-region is most important for th receptor binding, and the G-region is most important for FSH binding. Analogue-G, with an HGC b-region and and FSH G-region, has high affinity to both LH and FSH receptors. A CNR NG or analogue-GT (ARR8924) is disperted with Bgills and SSH and lighted with oil purcleoted ANT12942, followed by expression in Escherichla coll INFS appla and a COS7 cell culture. An analogue with a low zatio of LHFFSH activity should be useful culturally for induction of ovulation in women with polycystic overy disease, or to increase spermatogenesis in azospermic males
                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                       Analogue 3 (human LH-beta(1-114)-linker-human-alpha(1-92)) is a specific example of a single chain gondotroph; chimeric proteins having a cholronic gonadotropin (GC) beta subunit at the N-terminus and a CC alpha-subunit at the C-terminus, joined by a linker of 1-16 (autho edids are claimed. The analogue has luteinising hormone (lutrophn) activity and is useful for inducing ovulation and increasing male fertility.

analog no:3 related to the invention. Analog no:3 is a fusion protein consisting of human lutelinishing hormone (EH) beta-subunit (1-114 maino acids) fused to human single chain gonadotropin alpha-subunit (1-92 maino acids) by a linker sequence. This analog serves as a useful starting compound for template directed vaccine design and for the development of hormone specific vaccines for use in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTMTRVLQGVLPALPQVVCNTR 61

The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, agonist and/or antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New glyco-protein hormone analogues – for inducing fertility a 
immuno-castration agents, for suppressing reproductive system 
development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                     Omery Match 71.9%; Score 559; DB 22; Length 234; Best Local Similarity 91.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human single chain forms of the glycoprotein charactery which is an aponisty or antagonist of luterinising hormone conformation of the conformation of strategies as the characteristic forms of single chain hormones are used in treating infertility, as a district forms of single chain hormones are used in treating infertility, as a district of extilization techniques, and other therepetic methods associated with the native hormones. The single chain hormones are useful as reagents in amoner similar to heterodiaers, as dispinstic tools to detect the presence of antibodies with respect to the native proteins in control cangents in amoner similar to heterodiaers, as dispinstic to detect the presence of antibodies with respect to the native proteins in control cangents in a manner similar to heterodiaers, as dispinstic to control canded as control reagents in assignance to which the native hormones bind. The single chain hormones are also used in affinity charmatographic preparation of receptors or antihormone antihodies; they are used as purification tools for antihormone antihodies; they are used as purification tools for solution of subsequent preparations of these materials and to monitor levels of single chain hormones administered as drugs. The single chain sith these new compounds, as substitutes for the heterodimeric forms of hormones. The present sequence is human single chain gonadotropin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /octor *Corresponds to 1-114 amino acids of human litteinising hormone (LH) beta-subunit*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a fusion/protein of the human leutenising
beta subunit and Jun. The invention relates to a
hormone (hill) beta subunit and Jun. The invention relates to a
concentral of parts and Jun. The invention relates to a
method of forming a cysteine knd Jun. The invention dealers to a
beta-subunits comprising attending a dimerisation domain (DD) to either
the N-terminal of both subunits or the N-terminus of the alpha-subunit and
to the N-terminal of both subunits or the N-terminus of the alpha-subunit and
to the N-terminus of the beta-subunit and dimerisation the products to form
a heterodimeric protein analog (III) The method is used to produce
a nalogues (sqonists or anatagonists) of deglycosylated glycoprotein
hormones, porteinfally useful, e.g. for treating infertility where caused
to polycystic ovarian disease (associated with excessive levels of
intentising hormone). Products that retain DD's are also useful as
call sequences, Attachment of a DD (which may be removed later)
and allows the combination of heterodimers, that have similar structures
cand thus receptor-bidding and immunogenic properties to native dimers,
and allows the combination of subunits that would otherwise combine
conditied without loss of activity, and attachment of the DD reduces
formation of homodimers have longer circulation times in

This sequence is a fusion protein of hid and Jun. The invention craited to a method of forming a cystelle knot protein (1) having alpha and beta-subunits comprising a traching a dimeriality protein (1) having alpha and beta-subunits comprising attaching a dimerialation domain (DD) to ceither the N-termin of both subunits or the N-terminus of the products to form a heterodiment of the beta-subunit and dimeriality captures to form a heterodiment of protein analog (1). The method is used to produce analogues (agonists or antagonists) of deglycosylated cylopprotein hormones, potentially useful. A for treating infartility where caused by polycystic ovarial disease (associated with excessive levels of intensing hormone). Products that retain DD are also useful as inno acid sequences). Attachment of a DD (which may be removed later; and thus receptor-binding and immunogenic properties) to native dimers, and thus receptor-binding and immunogenic properties) to native dimers, and thus receptor-binding and immunogenic properties) to native dimers, cand allows the combination of subunits that vould othersies combination of subunits that vould othersies completed poorly, or not at all. The N-terminal part of a glycoprotein hormone my poorly, or not at all. The N-terminal part of a glycoprotein hormone my formation of homodimers. Heterodimers have longer circulation times in vivo than individual subunits:
                                                                                                                                                                                    Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hGG; human; chorionic gonadotrophin; bea subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Match 2014%; Score 555; DB 20; Length 242; Local Similarity 86.8%; Pred. ```
The sequence is an analogue comprising amino acids 1-118 of mature hGC beta subunit having residues 102-107, 109, 10, and 112-118 replaced by the corresponding residues in the hESH protein. It was prepd. by site directed mutagenesis of a cDNA sequence encoding the hGC bets subunit. The chimmert o hormone is capable of directing hormone binding to both lA and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AAR1504.) AAR15061-R15125 and AAR15161-R15125
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTWTRVLQGVLPALPQVVCNYR 60
